System Login Guide

v 1.0.0

1 Authorization Module

Login is done using an email address (can also be a personal ID, mobile number, etc.) and a password. A new user is created by the admin in the system, after which the system automatically generates a one-time login code.

1.1 Login Form

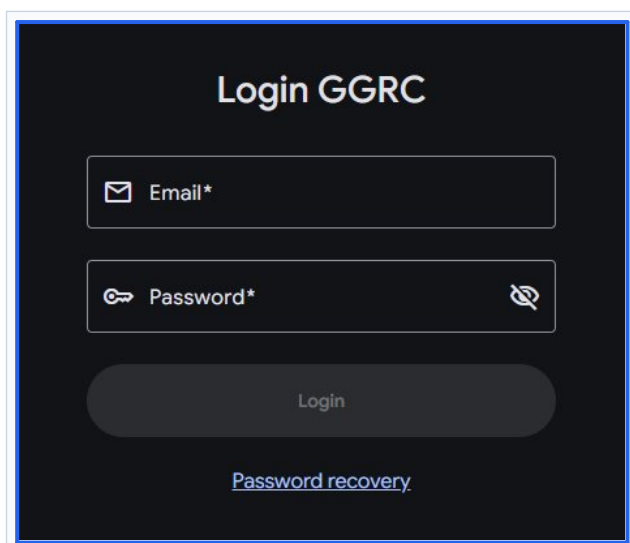

Fig. 1 — Login form

Field	Description
Email	The user's email address specified by the admin during registration
Password	Password or one-time code for the first login

1.2 First Login — One-Time Code

After the admin creates a new user, the system automatically generates a one-time code. Consider this specific example:

Parameter	Value
User	test@gmail.com
Role	Doctor
One-time code	519888

On first login, the user enters their email and one-time code, then clicks "Login". The system automatically redirects them to the password setup page.

1.3 Setting a Password

The password setup page opens only when the user has not yet set a password. The system asks the user to enter and confirm their desired password.

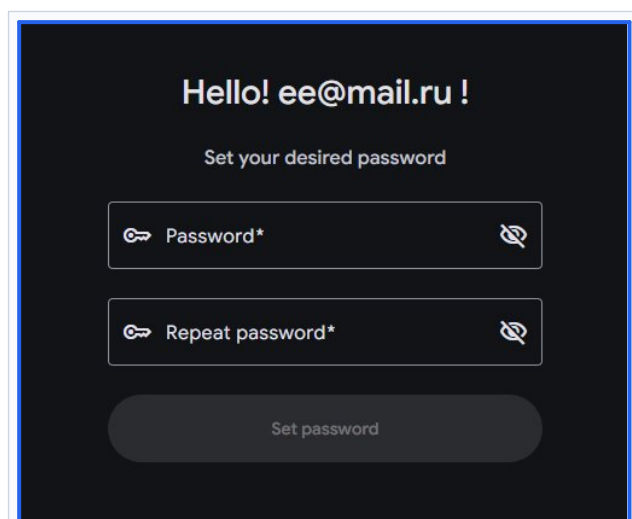

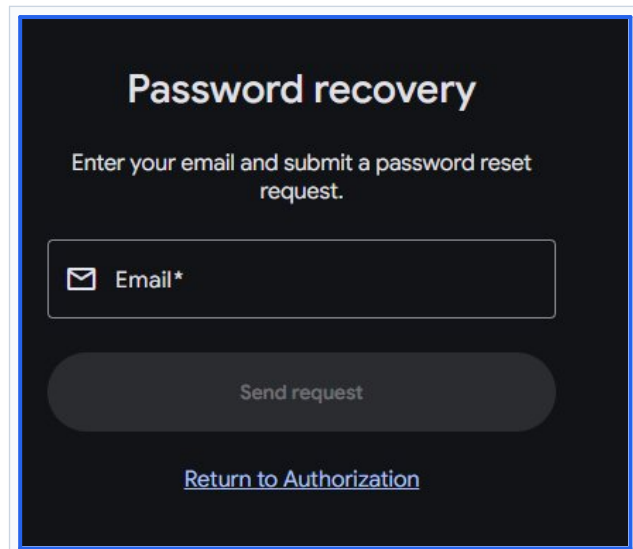

Fig. 2 — Password setup page

Field	Description
Password	Desired new password
Confirm password	Password confirmation

After setting the password, the system automatically redirects the user to the page corresponding to their role — e.g. a doctor is redirected to the doctor panel, a registrar to the registrar panel.

1.4 Password Recovery

By clicking "Forgot password" on the login page, the user is taken to the password recovery page.

Password recovery

Enter your email and submit a password reset request.

✉ Email *

Send request

[Return to Authorization](#)

Fig. 3 — Password recovery page

The password recovery process follows these steps:

Step	Action	Actor
1	User enters their email and submits the request	User
2	Notification is sent to the admin in the notifications module	System
3	Admin generates a new password and sends it by email	Admin
4	User logs in with the new password and sets a preferred one	User
